

Assignment -2
Python Programming

Assignment Date	26 September 2022
Student Name	Mr.Gokul R
Student Roll Number	621319106020
Maximum Marks	2 Marks

Question-1:

Build a python code, Assume you get temperature and humidity values (generated with random function to a variable) and write a condition to continuously detect alarm in case of high temperature.

Program: `t=int(input("enter the temperature")) h=int(input("enter the humidity")) while(t>35):
print("buzzer on")`

The screenshot shows a Windows desktop environment. On the left, there is a taskbar with icons for Arduino, This PC - Shortcut, Recycle Bin, Control Panel, Microsoft Edge, Google Chrome, and FileMorph... The main window is titled "Python 3.6.5 Shell" and contains the following code:

```
File Edit Shell Debug Options Window Help
t=int(input("enter the temperature"))
h=int(input("enter the humidity"))
while(t>35):
    print("buzzer on")
```

The output of the program is displayed in the shell window, showing the text "buzzer on" repeated 20 times. The taskbar at the bottom shows the search bar, task view button, and several open applications. The system tray on the right indicates a temperature of 29°C, Haze weather, and the date/time as 09:29 AM on 24-09-2022.

```
Program 2: import time from
random import randint
file=open("data.txt","a") n=5
for i in range(n):
    humidity=randint(0,100)+1
    temperature=randint(-100,100)+1 if
    humidity>45: print("\n \n Humidity
    High")
    print(humidity)

    file.write("\nHumidity")
    file.write(str(humidity))

    if temperature>30:
    print("Temperature High")
    print( temperature)

    file.write("\nTemperature")
    file.write(str(temperature))

    time.sleep(1) file.close()
```

```
import time
from random import randint
file=open("data.txt","a")
n=5
for i in range(n):
    humidity=randint(0,100)+1
    temperature=randint(-100,100)+1
    if humidity>45:
        print("\n \n Humidity High")
        print(humidity)
        file.write("\n\nhumidity")
        file.write(str(humidity))
    if temperature>30:
        print("Temperature High")
        print(temperature)
        file.write("\n\nTemperature")
        file.write(str(temperature))
    time.sleep(1)
file.close()
```

```
